Supervisory Patent Examiner, Art Unit 1795

Continuation of 11. does NOT place the application in condition for allowance because: Regarding the rejections under 35 U.S.C. 103(a). Hying et al. relates to an ion-conducting composite which is permeable to matter. The teachings of Hying et al. are used to modify the battery (electrochemical cells) separator Shi et al. with a specific inorganic coating known in the art to apply broadly to electrochemical cells. Applicant argues that the combination is improper because the application of Hying et al. would alter the principal operation of the primary reference. Examiner is not persuaded because both references apply to the transportation of ions through a separating medium. There is no teaching from either reference that a "surface diffusion mechanism" would destroy or alter the use of the separator of Shi et al. in a battery.

Regarding the rejections under 35 U.S.C. 112, first paragraph, Applicant notes the language in the specification regarding an aluminum oxide suspended in a sol of aluminum to support Claim 25. The sol is later treated and becomes the material arbeing oxide particles. However, Applicant has not pointed to language where the particles are adhered together by the aluminum oxide. Only the sol of aluminum (pgs. 11-13) and an oxide of Zr or Sig pg. 7, line 17) are discussed to adhere the particles. Applicant proise to, slines 3-8 to support "imxtures thereof" in Claim 5. However, the language Applicant regards as supporting "the polymeric fibers of the carrier" relate to the shutdown laver and not the carrier.
